

Shorts Script Builder

Open **Shorts-Script-Builder.html** in Chrome, Edge, Safari or Firefox (double-click it). It works offline in a desktop or laptop browser, with no sign-up and no AI. Print **Hook-Library-Printable.pdf** (128 hooks) and **Worked-Scripts-Printable.pdf** (32 finished scripts) to keep on your desk.

Four steps, one file

1

BUILD

Pick niche, hook, length

Choose 1 of 8 niches, 1 of 8 hook types and 15, 30, 45 or 60 s. Type your topic and press **Build script**. You get timed segments with word budgets, visual hints, caption focus words and a voice tone.

2

TIME & EDIT

Write it in your words

Press **Send to editor**, then rewrite every sample line and [BRACKET]. The timer shows seconds per segment at your wpm. Red means that segment runs more than 10 percent long.

3

CAPTIONS

Export an .srt

Split your lines into captions of 1 to 5 words (or one per sentence) and press **Download .srt** for your editor.

4

LIBRARY

Save, track, batch

Save scripts as Draft, Recorded or Posted, filter, export CSV, back up to .json. In **Batch & My hooks**, paste up to 30 topics to create Drafts at once, or add your own hooks.

Find your words per minute

Read any 30-second script out loud (or run it through your text-to-speech voice) with a timer. Count the words you got through, then double it.

your wpm = **words read in 30 s** × 2

PRESET	WPM	GOOD FOR
Slow	130	Calm, story-style narration
Natural	150	Default conversational read
Fast	170	Punchy facts and lists
TTS	180	Many text-to-speech voices

Custom: type any value from 100 to 220 in the box next to the presets.

Pauses with //

Type **//** where the voice should breathe. Each one adds 0.4 s to the timer and is never counted as a word.

So I said it: **//** I'm not going.

- Timing: seconds = words ÷ wpm × 60, plus 0.4 s per **//**
- Example: 30 words + one **//** at 150 wpm = 12.4 s
- Word budget per segment = floor(seconds × wpm ÷ 60)
- Captions also stop at every . ! or ? so two sentences never share one caption.

Timings are estimates from your words-per-minute setting. Nudge them in your editor after adding the voiceover.

Add your .srt to an editor

Menus differ between editors and versions, but the steps are the same:

1. Put the voiceover on the timeline.
2. Use **import captions / subtitles** and pick your .srt (CapCut desktop: captions import; Premiere Pro: import the .srt, drag it to a caption track; DaVinci Resolve: Media Pool, then a subtitle track).
3. Start the captions at 0:00, play it back and drag edges to match the audio. Small nudges are normal.
4. Style the captions inside your editor.

FAQ

Does it work offline?

Yes. It is a single HTML file with no outside links, fonts or tracking. Open it from your downloads folder or desktop.

Do I need AI or an account?

No. Templates and timing run in your browser. You write the final words; the tool structures and times them.

Which niches, and how many hooks per niche?

8 niches, 16 hook templates per niche (8 hook types × 2): Reddit-Style Stories, History, Science, Space, Psychology, Money Basics, Motivation, AI Tool Tips. No True Crime.

A simple routine for each Short

1 • Pick and build (2 min)

Choose a hook from the printed library, tick its box, then build the matching niche and hook type in the tool.

3 • Export (1 min)

Copy the TXT for your voiceover or TTS tool and download the .srt for captions.

Back up and move your library

Scripts are saved only in the browser you use, on that device. Nothing is uploaded.

1. In **Library**, press **Backup .json** and keep the file.
2. On another computer or browser, open the same HTML file, go to **Library** and press **Restore .json**.

Clearing browser site data clears the library too, so back up first. **Export CSV** columns:

```
title, niche, hook_type, duration_s, wpm, word_count,
est_seconds, status, date, script
```

Does it work on my phone?

Use a computer for the full tool. The layout fits a phone, but we have not tested a local HTML file on iPhone or Android; iPhone Files previews don't run it. The free Lite version works in phone browsers.

Are the times exact?

No. They are estimates from word count, your wpm and pauses. Measure your wpm once, then adjust captions after the voiceover.

Can I import my own hooks or batch a week?

Yes. Paste hooks or import a CSV (niche, hook_type, template) in Batch & My hooks. Batch makes Draft skeletons for up to 30 topics; you still write each script. Max 60 s each.

2 • Rewrite and time (5 min)

Replace every bracket with checked facts in your own words until the total turns green at your wpm.

4 • Track (1 min)

Save to Library as Draft, then switch it to Recorded and Posted as you go.

What this is NOT

Not an AI writer. It gives you original templates and timing. You write the final script.

Not a video editor. It exports text, .srt and .csv. Editing happens in your own editor.

Not a promise of results. No promise of views, followers or income.
