

Shorts Script **Builder**

Open **Shorts-Script-Builder.html** in Chrome, Edge, Safari or Firefox (double-click it). It works offline, on desktop and phone, with no sign-up and no AI.

Four steps, one file

1

BUILD

Pick niche, hook, length

Choose 1 of 8 niches, 1 of 8 hook types and 15, 30, 45 or 60 s. Type your topic and press **Build script**. You get timed segments with word budgets, visual hints, caption focus words and a voice tone.

2

TIME & EDIT

Write it in your words

Press **Send to editor**, then rewrite every sample line and [BRACKET]. The timer shows seconds per segment at your wpm. Red means that segment runs more than 10 percent long.

3

CAPTIONS

Export an .srt

Split your lines into captions of 1 to 5 words (or one per sentence) and press **Download .srt** for your editor.

4

LIBRARY

Save, track, export

Save scripts as Draft, Recorded or Posted. Filter by niche or status, reopen to edit, export CSV, back up to .json.

Find your words per minute

Read any 30-second script out loud (or run it through your text-to-speech voice) with a timer. Count the words you got through, then double it.

your wpm = **words read in 30 s** × 2

PRESET	WPM	GOOD FOR
Slow	130	Calm, story-style narration
Natural	150	Default conversational read
Fast	170	Punchy facts and lists
TTS	180	Many text-to-speech voices

Custom: type any value from 100 to 220 in the box next to the presets.

Pauses with //

Type **//** where the voice should breathe. Each one adds 0.4 s to the timer and is never counted as a word.

So I said it: **//** I'm not going.

- Timing: seconds = words ÷ wpm × 60, plus 0.4 s per **//**
- Example: 30 words + one **//** at 150 wpm = 12.4 s
- Word budget per segment = floor(seconds × wpm ÷ 60)

Timings are estimates from your words-per-minute setting. Nudge them in your editor after adding the voiceover.

Add your .srt to an editor

Record or generate the voiceover first, then bring in the captions. Every editor names the menu a little differently, and menus change between versions, but the steps are the same:

1. Open your project and place the voiceover on the timeline.
2. Use the editor's **import captions / import subtitles** option (or import the .srt like a media file) and choose the file you downloaded.
3. Drop the captions on a caption or subtitle track starting at 0:00.
4. Play it back and drag caption edges to match the audio. The .srt timings are estimates, so small nudges are normal.
5. Style the captions (font, size, highlight color) inside your editor.

Editor notes

- **CapCut (desktop):** look for the captions import option and pick your .srt. Options vary by version and platform.
- **Premiere Pro:** import the .srt into the project, then drag it onto the timeline as a caption track.
- **DaVinci Resolve:** import the .srt into the Media Pool, then drag it onto a subtitle track.

FAQ

Does it work offline?

Yes. It is a single HTML file with no outside links, fonts or tracking. Open it from your downloads folder or desktop.

Do I need AI or an account?

No. Templates and timing run in your browser. You write the final words; the tool structures and times them.

Back up and move your library

Your scripts are saved only in the browser you use, on that device. Nothing is uploaded.

1. In the **Library** tab, press **Backup .json**. Keep the file somewhere safe.
2. On the other computer (or another browser), open the same HTML file, go to **Library** and press **Restore .json**.
3. Scripts with the same ID are updated; new ones are added.

Clearing your browser's site data also clears the library, so back up before you do that.

Export CSV

Export CSV saves the scripts you see (after filters) with these columns:

```
title, niche, hook_type, duration_s, wpm,
word_count, est_seconds, status, date, script
```

The script column joins all segments with " | ". Open it in Excel, Numbers or Google Sheets.

Does it work on my phone?

Yes, in a mobile browser. Copy the file to your phone and open it in the browser (some phones open HTML files more easily from a files app). The layout fits a 390 px wide screen.

Are the times exact?

No. They are estimates from word count, your wpm and pauses. Measure your real wpm once, then adjust captions after the voiceover.

What this is NOT

Not an AI writer. It gives you original templates and timing. You write the final script.

Not a video editor. It exports text, .srt and .csv. Editing happens in your own editor.

Not a promise of results. No promise of views, followers or income.
