FACELESS CREATOR KIT

Psychology Facts Shorts Script Vault

FOR FACELESS PSYCHOLOGY CHANNELS · SHORTS · REELS · TIKTOK

150 hooks · 60 timed scripts: 20× 30s · 20× 45s · 20× 60s

Verify with · Evidence tag · Myth check on every script

Well supported | Mixed | × Did not replicate

Every script names where to check the claim and says how solid the evidence is, so you don't post pop-psych myths.

PDF · 80 pages · Letter + A4
hooks.csv · scripts.csv · script_beats.csv

Faceless Creator Kit

Contents

Every line is a link. Hooks are numbered H001–H150, scripts S01–S60. The small meter shows each script's Evidence tag (3 bars = Well supported, 2 = Mixed, ✕ = Did not replicate).

How to use this vault

150 psychology hooks and 60 finished scripts, each timed beat by beat: what to say, what to show, where to pause and how to sound. Seven steps from page to posted video:

1. **Pick a hook**
   Browse the hook library (pages 6–15): 10 hook types, 15 hooks each. Use one as an opener, a title idea or a cover line.

2. **Pick a script**
   Use the script index (page 16) to choose by length (30, 45 or 60 s), theme, topic and Evidence tag. Each script fits on one page.

3. **Check “Verify with” and the Evidence tag**
   Look the core claim up in the named reference before you record. The Evidence tag tells you how firmly you can say it; the “Myth check” line shows the popular wrong version.

4. **Swap the 3 “Make it yours” points**
   Each script lists 3 concrete swaps: a different opening, visual or question. Change at least one so the video is your own.

5. **Record the voiceover**
   Your own voice or any text-to-speech voice. Read the Voiceover column and pause where the Caption / pause column says (‖ = pause, ▸ = new caption card).

6. **Add visuals per beat**
   The Visual column names one visual type per beat: an on-screen test, a simple diagram, an illusion graphic, animated icons or a stock clip you have a license for.

7. **Post it**
   Copy the “Ready to post” box: title, one-line description, 3 hashtags, cover text, and the comment to pin.

The read-speed rule		`2.5 words / second = 150 wpm`
`30 s 55–75 words | 45 s 85–112 | 60 s 115–150 · 2.5 words/s`		
30 s scripts	5 beats	beat 1 = 0–3 s (the hook)
45 s scripts	6 beats	last beat = payoff + comment question
60 s scripts	8 beats	each beat: at most 2.5 × seconds + 2 words

Working in bulk?

The same text is in 3 CSV files: `hooks.csv`, `scripts.csv` (one row per script) and `script_beats.csv` (one row per beat). Import them into Google Sheets or Excel; see README.txt.

Accuracy, evidence & platform notes

Psychology channels get corrected in the comments fast, often about studies that didn't replicate. Every script carries one of these three tags:

Well supported

Repeatedly replicated, or textbook consensus. The voiceover can state it plainly, usually as a tendency.

Mixed

A real effect, but smaller, debated or limited to some conditions. The voiceover says so out loud.

× Did not replicate

A famous claim that large replication attempts or careful tests did not confirm. The voiceover treats it as a myth.

How the scripts hedge

Only widely documented findings are used. Studies are named as Author (year), numbers are rough ("about", "roughly"). "Mixed" scripts say "some studies found" or "the effect is smaller than first claimed"; "Did not replicate" scripts present the claim as a myth, never as a fact.

We are not psychologists

Scripts are written from widely documented psychology and our build process checked them for internal consistency, but **we are not psychologists, and no outside expert reviewed the scripts. Check each claim against the named reference before posting.** This is educational entertainment, **not mental-health advice or diagnosis**.

If a viewer corrects you

Thank them, check the point in the named reference, and if they are right, pin a correction comment and fix the description.

Visual rights and AI disclosure

Use stock you have a license for, your own graphics, or public-domain images. Never use clips from TV shows or films. Follow each platform's rules on AI-generated or synthetic content and turn on its disclosure label when a rule applies.

No promises

No script can promise views, followers, monetization or income. This vault saves research, writing and timing work; the channel is still yours to build.

01
OF 10

Your brain is lying

Open on something the viewer's brain is doing right now without them noticing. Name it in the first 3 seconds, explain it in beat 2.

`Your brain is [DOING X] right now. + [what it is called]`

H001	Your brain is filling in a hole in your vision right now.	Perception	12 w
H002	You can't tickle yourself. Your brain predicts the touch before it lands.	Emotions	12 w
H003	Your brain hides a blur every time your eyes jump.	Perception	10 w
H004	Every time you recall a memory, your brain can quietly change it.	Memory & learning	12 w
H005	Right now your brain is ignoring the feeling of your socks.	Perception	11 w
H006	Your brain judges a face in a fraction of a second.	Biases	11 w
H007	Your brain treats a stranger's confidence like proof. It isn't.	Biases	10 w
H008	In a loud room, your brain still catches your own name.	Perception	11 w
H009	Your brain may remember unfinished tasks longer. Or so the theory says.	Memory & learning	12 w
H010	Your brain thinks a long line means a better restaurant.	Decisions	10 w
H011	Your brain sees motion in this still picture. Nothing is moving.	Perception	11 w
H012	Your brain makes a loss sting more than the same gain feels good.	Decisions	13 w
H013	Your brain notices bad news faster than good news.	Emotions	9 w
H014	Your brain may replay what you learned today while you sleep.	Sleep & dreams	11 w
H015	Your brain fills the gaps in a story with details that never happened.	Memory & learning	13 w

Say it, then check it. Up to 9 words fit the 0–3 s hook beat; let a longer hook run into beat 2. Match your wording to the Evidence tag of the script you pair it with, and check the claim in its "Verify with" reference.

02
OF 10

Try this now

Give the viewer a 3-second test they can do on screen, then reveal what happened in beat 2. Show the test before you explain it.

```
Try this: [QUICK ON-SCREEN TEST]. + [reveal in beat 2]
```

RED
BLUE
GREEN

H016	Say the color of each word, not the word itself. Go.	Perception	11 w
H017	Close one eye and stare at the cross. The dot will vanish.	Perception	12 w
H018	Read this list once. In ten seconds I'll ask what was in it.	Memory & learning	13 w
H019	Stare at the dot for twenty seconds, then look at a white wall.	Perception	13 w
H020	Which line is longer? Answer before the arrows disappear.	Perception	9 w
H021	Count the passes the white team makes. Don't miss one.	Perception	10 w
H022	Spot what changes between these two pictures. Take your time.	Perception	10 w
H023	Watch the mouth and listen. Now close your eyes. Did the sound change?	Perception	13 w
H024	Try to remember these seven digits without writing them down.	Memory & learning	10 w
H025	Look at this outlet. Do you see a face? You're not alone.	Perception	12 w
H026	Guess: is the population of this city above or below this number?	Biases	12 w
H027	Rate this face in half a second. Trustworthy or not?	Biases	10 w
H028	Picture a cheap, a mid-price and a pricey popcorn. Which do you pick?	Decisions	13 w
H029	Say 'silk' five times fast. Now, what do cows drink?	Memory & learning	10 w
H030	Try to remember a dream from last night. How much is left?	Sleep & dreams	12 w

Say it, then check it. Up to 9 words fit the 0–3 s hook beat; let a longer hook run into beat 2. Match your wording to the Evidence tag of the script you pair it with, and check the claim in its “Verify with” reference.

03
OF 10

Famous experiment

Open with the year and the setup of a textbook study. Keep the result for beat 2 or 3 so viewers stay to hear it.

```
In [YEAR], a psychologist asked people [SIMPLE TASK]… + [the result]
```

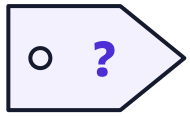

H031	In 1951, a psychologist asked people to judge which line was longest.	Classic experiments	12 w
H032	In 1963, volunteers were told to give shocks. The shocks weren't real.	Classic experiments	12 w
H033	In 1971, students were split into guards and prisoners in a basement.	Classic experiments	12 w
H034	In 1961, kids watched an adult punch a doll. Then they played.	Classic experiments	12 w
H035	In 1974, people watched a car crash film. One word changed their memory.	Memory & learning	13 w
H036	In 1885, one man memorized nonsense syllables to measure forgetting.	Memory & learning	10 w
H037	In 1953, researchers noticed sleepers' eyes darting under their eyelids.	Sleep & dreams	10 w
H038	In 1968, students heard someone seem to have a seizure. Who helped?	Classic experiments	12 w
H039	In 1959, students were paid to lie about a boring task.	Classic experiments	11 w
H040	In 1999, about half of viewers counting passes missed a gorilla suit.	Perception	12 w
H041	In 1960, students tried to find the rule behind 2, 4, 6.	Biases	12 w
H042	In 1924, two psychologists tested memory after sleep versus after a day awake.	Sleep & dreams	13 w
H043	In 1974, researchers spun a wheel of fortune before asking a simple question.	Biases	13 w
H044	Over a century ago, an engineer measured how hard teams pulled a rope.	Classic experiments	13 w
H045	In 1979, psychologists asked people to choose between a sure loss and a gamble.	Decisions	14 w

Say it, then check it. Up to 9 words fit the 0–3 s hook beat; let a longer hook run into beat 2. Match your wording to the Evidence tag of the script you pair it with, and check the claim in its “Verify with” reference.

04
OF 10

Name that bias

Describe an everyday situation and let viewers guess the name in the comments. Reveal the term in beat 2.

`[EVERYDAY SITUATION]. Name it. + [reveal the term in beat 2]`

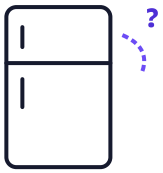

H046	You keep watching a bad movie because you paid for the ticket. Name it.	Decisions	14 w
H047	After the game, you 'knew it all along.' What's that called?	Biases	11 w
H048	You only notice news that proves you right. Name that bias.	Biases	11 w
H049	You think everyone noticed your stain. Almost nobody did. Name it.	Biases	11 w
H050	One good trait makes you assume a person is good at everything. Name it.	Biases	14 w
H051	Plane crashes feel more common than they are. What's that bias?	Biases	11 w
H052	They cut you off: rude. You cut them off: bad day. Name it.	Biases	13 w
H053	You value your old mug more just because it's yours. Name it.	Decisions	12 w
H054	A medium popcorn priced near the large makes the large look smart. Name it.	Decisions	14 w
H055	The worst scorers rated themselves above average. Name the effect.	Biases	10 w
H056	Everyone in the group slacks a little when the work is shared. Name it.	Classic experiments	14 w
H057	A song you disliked grows on you after a few plays. Name it.	Emotions	13 w
H058	You recall a list's first and last items best. What's that called?	Memory & learning	12 w
H059	Everyone in the room agrees, so you change your answer. Name it.	Classic experiments	12 w
H060	You pick the default option on every form without reading. Name it.	Decisions	12 w

Say it, then check it. Up to 9 words fit the 0–3 s hook beat; let a longer hook run into beat 2. Match your wording to the Evidence tag of the script you pair it with, and check the claim in its “Verify with” reference.

05
OF 10

Why you always...

Start with a habit everyone recognizes, then give the documented explanation. Keep the explanation as hedged as its evidence.

`Why you [EVERYDAY HABIT]. + [the documented reason]`

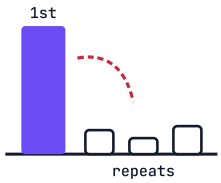

H061	Why do you forget why you walked into a room?	Memory & learning	10 w
H062	Why a word sits on the tip of your tongue and won't come out.	Memory & learning	14 w
H063	Why you hear your own name across a noisy party.	Perception	10 w
H064	Why dreams fade so fast after you wake up.	Sleep & dreams	9 w
H065	Why you see faces in clouds, cars and power outlets.	Perception	10 w
H066	Why cramming the night before feels like it works, but doesn't last.	Memory & learning	12 w
H067	Why you keep paying for the gym you never use.	Decisions	10 w
H068	Why you feel awkward hours after a tiny mistake.	Emotions	9 w
H069	Why one bad review sticks with you more than ten good ones.	Emotions	12 w
H070	Why you remember the end of a vacation more than the middle.	Emotions	12 w
H071	Why you feel sleepy in the afternoon even after a good night.	Sleep & dreams	12 w
H072	Why you can't stop thinking about a show that ended on a cliffhanger.	Memory & learning	13 w
H073	Why you go along with the group even when you disagree.	Classic experiments	11 w
H074	Why the person who names a number first sets the price.	Biases	11 w
H075	Why familiar faces start to feel friendlier over time.	Emotions	9 w

Say it, then check it. Up to 9 words fit the 0–3 s hook beat; let a longer hook run into beat 2. Match your wording to the Evidence tag of the script you pair it with, and check the claim in its “Verify with” reference.

06
OF 10

Didn't replicate

Name a famous finding, then tell viewers what happened when labs ran it again. Pair with scripts tagged "Did not replicate" or "Mixed".

```
You've heard [FAMOUS FINDING]. + [what the repeat studies found]
```

H076	You've heard willpower runs out like fuel. Big repeat studies found almost nothing.	Myths & replication	13 w
H077	Power poses were said to change your hormones. Repeat studies didn't find that.	Myths & replication	13 w
H078	The famous pen-in-teeth smile study? A 17-lab repeat found no effect.	Emotions	11 w
H079	Reading words about old age made people walk slower. Later labs couldn't repeat it.	Biases	14 w
H080	Thinking about professors to ace a quiz? That priming effect didn't replicate.	Memory & learning	12 w
H081	The marshmallow test predicted less than you were told.	Classic experiments	9 w
H082	Too many jam choices stop shoppers buying? Later studies found mixed results.	Decisions	12 w
H083	Holding a warm drink makes you judge people warmer? Repeat studies struggled.	Emotions	12 w
H084	Washing your hands to ease guilt? Repeat studies mostly didn't find it.	Emotions	12 w
H085	Pictures of eyes make people more honest? Bigger studies found the effect shaky.	Classic experiments	13 w
H086	A sugary drink restores willpower? Later work found that claim weak.	Decisions	11 w
H087	A 2011 study claimed people sensed the future. Repeat attempts found nothing.	Myths & replication	12 w
H088	Seeing red makes you score worse on tests? Retests found much weaker effects.	Perception	13 w
H089	Playing Mozart won't make babies smarter. The original study tested college students.	Myths & replication	12 w
H090	The Stanford prison experiment is famous. Its conclusions are heavily disputed now.	Classic experiments	12 w

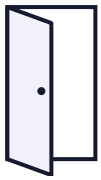

Say it, then check it. Up to 9 words fit the 0–3 s hook beat; let a longer hook run into beat 2. Match your wording to the Evidence tag of the script you pair it with, and check the claim in its "Verify with" reference.

07
OF 10

Memory glitch

Open on a memory error the viewer has had themselves. Name the glitch, then explain what memory research says about it.

`You remember [X]. + [why that memory can be wrong]`

H091	You walked into the kitchen and forgot why. The doorway may be to blame.	Memory & learning	14 w
H092	Your clearest memory of a big day may be the least accurate.	Memory & learning	12 w
H093	One word in a question can change what witnesses remember.	Memory & learning	10 w
H094	You can remember an event that never happened. Labs have shown it.	Memory & learning	12 w
H095	Try drawing a coin from memory. People get it wrong surprisingly often.	Memory & learning	12 w
H096	You reread your notes three times and still blanked. Here's a better way.	Memory & learning	13 w
H097	You'd swear you said it. Your friend swears they did.	Memory & learning	10 w
H098	You remember the gist of a list, plus a word that wasn't there.	Memory & learning	13 w
H099	Seven is the famous memory limit. The real number may be smaller.	Memory & learning	12 w
H100	You remember a dream for seconds, then it's gone.	Sleep & dreams	9 w
H101	Your memory of a song's lyrics can be confidently wrong.	Emotions	10 w
H102	A night of sleep can help a new memory stick.	Sleep & dreams	10 w
H103	You forget much of what you learn within days, unless you review it.	Memory & learning	13 w
H104	Few people remember anything before age three. It has a name.	Memory & learning	11 w
H105	You can forget a name while remembering their job, hobbies and dog.	Memory & learning	12 w

Say it, then check it. Up to 9 words fit the 0–3 s hook beat; let a longer hook run into beat 2. Match your wording to the Evidence tag of the script you pair it with, and check the claim in its "Verify with" reference.

08
OF 10

There's a word for that

Describe a feeling everyone knows, then give its name. Works well as a reply to comments and as a series.

```
There's a name for [FEELING OR HABIT]. + [the term and what it means]
```

a word

H106	There's a name for seeing faces in things that aren't faces.	Perception	11 w
H107	There's a word for a song stuck in your head on repeat.	Emotions	12 w
H108	There's a name for waking up unable to move for a few seconds.	Sleep & dreams	13 w
H109	There's a word for knowing you're dreaming while you dream.	Sleep & dreams	10 w
H110	There's a name for forgetting why you entered a room.	Memory & learning	10 w
H111	There's a name for the jolt you feel just as you fall asleep.	Sleep & dreams	13 w
H112	There's a word for liking something just because it's familiar.	Emotions	10 w
H113	There's a name for thinking you knew it all along.	Biases	10 w
H114	There's a name for doing less work when you're in a group.	Classic experiments	12 w
H115	There's a word for the sleepy dip you feel after lunch.	Sleep & dreams	11 w
H116	There's a name for not seeing something right in front of you.	Perception	12 w
H117	There's a name for remembering the start and the end, but not the middle.	Memory & learning	14 w
H118	There's a name for judging an experience by its peak and its end.	Emotions	13 w
H119	There's a word for a feeling of 'I've lived this moment before.'	Emotions	12 w
H120	There's a name for a sound that changes when you watch the lips.	Perception	13 w

Say it, then check it. Up to 9 words fit the 0–3 s hook beat; let a longer hook run into beat 2. Match your wording to the Evidence tag of the script you pair it with, and check the claim in its "Verify with" reference.

09
OF 10

Myth busted

Quote the popular claim, then say what the evidence shows. Match your wording to the script's Evidence tag.

`You've heard [POP-PSYCH MYTH]. + [what the evidence says]`

H121	You've heard we only use 10% of our brains. Brain scans disagree.	Myths & replication	12 w
H122	You've heard you're either left-brained or right-brained. Brain scans don't show it.	Myths & replication	12 w
H123	You've heard you learn best in your 'learning style.' Tests don't back it.	Myths & replication	13 w
H124	You've heard humans now have shorter attention spans than goldfish. There's no good source.	Myths & replication	14 w
H125	You've heard punching a pillow lets your anger out. Studies say it doesn't.	Emotions	13 w
H126	You've heard opposites attract. Research mostly finds similar people pair up.	Emotions	11 w
H127	You've heard listening to classical music makes you smarter. Not quite.	Myths & replication	11 w
H128	You've heard habits take 21 days. One study found it often took much longer.	Emotions	14 w
H129	You've heard lie detectors catch liars. Scientists say they're not reliable.	Classic experiments	11 w
H130	You've heard eyes looking up-left mean someone's lying. Tests found nothing.	Classic experiments	11 w
H131	You've heard dreams last only a few seconds. Lab studies suggest otherwise.	Sleep & dreams	12 w
H132	You've heard you can learn a language in your sleep. Not really.	Sleep & dreams	12 w
H133	You've heard memory works like a video camera. It doesn't.	Memory & learning	10 w
H134	You've heard sugar makes kids hyper. Blind studies didn't find that.	Emotions	11 w
H135	You've heard the full moon makes people act strange. Data says no.	Emotions	12 w

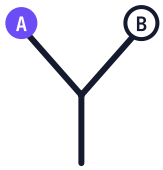

Say it, then check it. Up to 9 words fit the 0–3 s hook beat; let a longer hook run into beat 2. Match your wording to the Evidence tag of the script you pair it with, and check the claim in its "Verify with" reference.

10
OF 10

Would you?

Ask the viewer to make a choice, then reveal what people in a classic study chose. Good for comment debates.

`Would you [CHOICE]? + [what people did in the study]`

H136	Would you give the wrong answer if everyone else did?	Classic experiments	10 w
H137	Would you rather a sure win or a coin flip for double?	Decisions	12 w
H138	Would you help a stranger if five other people were watching?	Classic experiments	11 w
H139	Would you eat one treat now or wait for two later?	Classic experiments	11 w
H140	Would you swap your mug for a chocolate bar? Many people won't.	Decisions	12 w
H141	Would you sign up as an organ donor if the box were pre-ticked?	Decisions	13 w
H142	Would a pricier option on the menu make you spend more?	Decisions	11 w
H143	Would you save 200 people for sure, or gamble on saving all 600?	Decisions	13 w
H144	Would you rather have a cold-water test end gently or end sooner?	Emotions	12 w
H145	Would you notice if the person you were talking to was swapped?	Perception	12 w
H146	Would you change your answer if a confident person disagreed?	Classic experiments	10 w
H147	Would you rather choose from six jams or twenty-four?	Decisions	9 w
H148	Would you lie about a boring task for a tiny payment?	Classic experiments	11 w
H149	Would you work as hard on a team as you would alone?	Classic experiments	12 w
H150	Would you sleep on a hard problem or keep working through the night?	Sleep & dreams	13 w

Say it, then check it. Up to 9 words fit the 0–3 s hook beat; let a longer hook run into beat 2. Match your wording to the Evidence tag of the script you pair it with, and check the claim in its “Verify with” reference.

The First Number You Hear Bends Your Guess

BEAT TIMELINE (SECONDS) · TOPIC: ANCHORING EFFECT

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	The first number you see quietly steers your guess.	Big number flashes, then a guess meter	▸ Big card: FIRST NUMBER	Curious
3–9	Psychologists call it anchoring. In a classic study, people spun a wheel of numbers before answering.	Spinning number wheel animation	‖ Pause after “anchoring”	Storyteller
9–16	They estimated the share of African countries in the United Nations. The wheel's number was meaningless.	Simple map icon with a question mark	▸ New card: “meaningless”	Explaining
16–23	Yet people who saw a high number gave higher estimates than people who saw a low one.	Two bars: high-anchor group vs low-anchor group	Highlight “higher estimates”	Reveal
23–30 CTA	Anchors work on prices, salaries and sale tags too. What's the last anchor that fooled you?	Price tag with a crossed-out number	Hold question 1.5 s	Warm

VERIFY WITH	Tversky & Kahneman (1974) · APA Dictionary of Psychology: “anchoring bias”
EVIDENCE	**Well supported.** Repeated many times with prices and estimates; the voiceover states it plainly.
MYTH CHECK	No common myth.

Make it yours

3 swaps so it’s your video

1. Open with a price you saw this week instead of the line.
2. Ask viewers a number question first, then reveal the anchor.
3. Swap the CTA: ask about the last sale that felt like a bargain.

Ready to post

TITLE The First Number You Hear Bends Your Guess

DESCRIPTION Why a random number can change your next guess.

HASHTAGS #psychology #anchoring #cognitivebias

COVER TEXT The number that tricks you

PIN Comment the last price that anchored you.

Why a Word Gets Stuck on the Tip of Your Tongue

BEAT TIMELINE (SECONDS) · TOPIC: TIP-OF-THE-TONGUE STATE

0 3 9 16 23 30

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	You know the word. It just won't come out.	On-screen text: blank word with a blinking cursor	▸ Big card: IT WON'T COME OUT	Relatable
3–9	That's the tip-of-the-tongue state. In a 1966 study, researchers read out definitions of rare words.	Dictionary icon, definition text appears	‖ Pause after "tip-of-the-tongue"	Explaining
9–16	When people got stuck, they could often guess the first letter and how many syllables it had.	Letter tiles: first letter lit, rest grey	▸ New card per clue	Curious
16–23	So the memory seems to be there. Your brain has the outline but can't reach the full sound.	Simple diagram: word outline, sound missing	Highlight "the outline"	Calm
23–30 CTA	It often pops back later on its own. Which word keeps escaping you?	Text: "Which word?" with a comment bubble	Hold question 1.5 s	Warm

VERIFY WITH	Brown & McNeill (1966) · APA Dictionary of Psychology: "tip-of-the-tongue phenomenon"
EVIDENCE	**Well supported.** A classic, often repeated finding; the voiceover only says the memory seems partly there.
MYTH CHECK	No common myth.

Make it yours

3 swaps so it's your video

1. Open with a rare-word definition and let viewers guess the word.
2. Show your own tip-of-the-tongue moment from this week as on-screen text.
3. Swap the CTA: ask for the rarest word viewers know.

Ready to post

TITLE Why a Word Gets Stuck on the Tip of Your Tongue

DESCRIPTION Why you can know a word and still not say it.

HASHTAGS #psychology #memory #tipofthetongue

COVER TEXT Know it, can't say it

PIN Comment a definition and let others guess the word.

Say the Color, Not the Word

BEAT TIMELINE (SECONDS) · TOPIC: STROOP EFFECT

0 3 9 16 23 30

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	Say the color of each word out loud. Go.	On-screen test: RED, BLUE, GREEN in mismatched ink	▸ Big card: SAY THE COLOR	Playful
3–9	Harder than it looked? Reading is so automatic the word fights the color you name.	Same list, the word and ink pulling apart	‖ Pause after “Harder than it looked?”	Teasing
9–16	This is the Stroop effect, published in 1935. People named ink colors more slowly when the word clashed.	Simple chart: matching vs clashing words, time bars	▸ New card: “Stroop effect”	Explaining
16–23	It has been repeated in many labs, and researchers still use it to study attention.	Lab icons and an attention meter	Highlight “many labs”	Steady
23–30 CTA	Try the list again, slower. Which color tripped you up?	The list again with a stopwatch icon	Hold list 2 s	Playful

VERIFY WITH	Stroop (1935) · APA Dictionary of Psychology: “Stroop effect”
EVIDENCE	**Well supported.** Repeated in many labs over decades; the voiceover states it plainly.
MYTH CHECK	No common myth.

Make it yours

3 swaps so it’s your video

1. Use your own color list: six words in mismatched ink.
2. Time yourself on screen and show your real result.
3. Swap the CTA: ask viewers to post their time.

Ready to post

TITLE Say the Color, Not the Word

DESCRIPTION A 5-second test that shows reading on autopilot.

HASHTAGS #psychology #stroopeffect #brainteaser

COVER TEXT Say the COLOR, not the word

PIN Post your time: how many seconds did the list take?

Pavlov's Dogs and the Bell That Probably Wasn't

BEAT TIMELINE (SECONDS) · TOPIC: CLASSICAL CONDITIONING

0 3 9 16 23 30

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	The famous drooling-dog bell? It may never have rung.	Animated bell icon with a question mark	▸ Big card: "NO BELL?"	Teasing
3–9	Around 1900, a Russian physiologist studying digestion saw his dogs drool before food even arrived.	Simple drawing: dog, food bowl, lab coat	‖ Pause after "arrived"	Storyteller
9–16	They had linked the lab sounds and the helpers with dinner. Later, a sound alone made them drool.	Diagram: sound + food → sound alone	▸ New card: "sound alone"	Explaining
16–23	That's classical conditioning. His writings mention metronomes and buzzers; whether a bell was used is debated.	Metronome and buzzer icons, bell greyed out	Highlight "is debated"	Fair
23–30 CTA	The learning part is real. What sound makes your pet come running?	Your pet reacting to a familiar sound	Hold question 1.5 s	Warm

VERIFY WITH	Pavlov (1927), Conditioned Reflexes · APA Dictionary of Psychology: "classical conditioning"
EVIDENCE	**Well supported.** Conditioning is textbook consensus; only the bell detail is described as debated.
MYTH CHECK	**Popular version:** Pavlov trained his dogs with a ringing bell. **Documented:** His accounts mention metronomes, buzzers and other sounds; whether a bell was used is debated.

Make it yours

3 swaps so it's your video

1. Show your own pet reacting to the treat-bag sound.
2. Open on a metronome icon instead of a bell.
3. Swap the CTA: ask which sound makes viewers hungry.

Ready to post

TITLE Pavlov's Dogs and the Bell That Probably Wasn't

DESCRIPTION The famous bell story, and what was really documented.

HASHTAGS #psychology #pavlov #conditioning

COVER TEXT The bell may never have rung

PIN Which everyday sound makes you hungry?

The Pre-Ticked Box That Decides for You

BEAT TIMELINE (SECONDS) · TOPIC: DEFAULT EFFECT

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	The box already ticked for you is powerful.	Animated checkbox ticking itself	▸ Big card: ALREADY TICKED	Curious
3–9	It's called the default effect. People tend to stick with whatever option is set unless they act.	Toggle switch icons, most left as set	‖ Pause after "default effect"	Explaining
9–16	A 2003 study compared European countries on organ donation, where you either opt in or opt out.	Simple Europe outline with two colors	▸ New card: "opt out"	Storyteller
16–23	Countries where donation was the default had far higher consent rates than countries where you had to tick.	Two bars: opt-out countries vs opt-in countries	Highlight "far higher"	Reveal
23–30 CTA	Same choice, different starting point. Which default have you never changed?	Phone settings screen mockup, toggles highlighted	Hold question 1.5 s	Warm

VERIFY WITH	Johnson & Goldstein (2003), organ donation defaults
EVIDENCE	**Well supported.** Replicated across many settings, from forms to savings plans; stated as a tendency.
MYTH CHECK	No common myth.

Make it yours

3 swaps so it's your video

1. Show a real settings screen and point at one default toggle.
2. Use a newsletter checkbox example instead of organ donation.
3. Swap the CTA: ask viewers to check one app default today.

Ready to post

TITLE The Pre-Ticked Box That Decides for You

DESCRIPTION Why the pre-ticked option wins so often.

HASHTAGS #psychology #defaulteffect #decisions

COVER TEXT The box decided for you

PIN Go check one default setting on your phone. What did you find?

Why Things Grow on You the More You See Them

BEAT TIMELINE (SECONDS) · TOPIC: MERE EXPOSURE EFFECT

0 3 9 16 23 30

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	You didn't like that song. Now you hum it.	Animated music note icon, thumbs down turning up	▸ Big card: "NOW YOU HUM IT"	Relatable
3–9	Psychologists call this the mere exposure effect: just seeing something again can make you like it more.	Repeating icon appearing again and again	‖ Pause after "mere exposure effect"	Explaining
9–16	In a 1968 study, people saw unfamiliar foreign words and characters different numbers of times.	On-screen made-up symbols repeated	▸ New card per symbol	Storyteller
16–23	The more often they'd seen one, the more positive they guessed its meaning was.	Rating scale sliding toward "good"	Highlight "more positive"	Reveal
23–30 CTA	It has limits: too much repetition can backfire. What grew on you over time?	Repeat counter ticking up, then a frown	Hold question 1.5 s	Warm

VERIFY WITH	Zajonc (1968) · APA Dictionary of Psychology: "mere-exposure effect"
EVIDENCE	**Well supported.** Well documented across many studies; the voiceover adds that the effect has limits.
MYTH CHECK	No common myth.

Make it yours

3 swaps so it's your video

1. Open by humming a tune you wrote yourself.
2. Show your own unfamiliar symbols and repeat one on purpose.
3. Swap the CTA: ask which food grew on viewers.

Ready to post

TITLE Why Things Grow on You the More You See Them

DESCRIPTION Why familiar things start to feel likable.

HASHTAGS #psychology #mereexposure #familiarity

COVER TEXT Why it grew on you

PIN Which song did you hate at first and love now?

Awake but Can't Move? What Sleep Paralysis Is

BEAT TIMELINE (SECONDS) · TOPIC: SLEEP PARALYSIS

0 3 9 16 23 30

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	You wake up, but your body won't move.	Simple drawing: bed, eyes open, body outline still	▸ Big card: CAN'T MOVE?	Calm
3–9	That's sleep paralysis. During dream sleep, most muscles go still so you don't act out dreams.	Sleep stage diagram, dream stage highlighted	‖ Pause after "sleep paralysis"	Explaining
9–16	Sometimes your mind wakes up a few seconds before that stillness switches off. You're aware but can't move.	Two timelines: mind awake, muscles still asleep	▸ New card: "aware but can't move"	Steady
16–23	It can feel scary, and some people see or sense things. It usually passes within seconds or minutes.	Soft clock icon, seconds ticking by	Highlight "usually passes"	Reassuring
23–30 CTA	It's common. Have you ever woken up unable to move?	Calm sunrise graphic with comment bubble	Hold question 1.5 s	Warm

VERIFY WITH	NHS: "Sleep paralysis" · APA Dictionary of Psychology: "sleep paralysis"
EVIDENCE	**Well supported.** Well described in sleep research; the voiceover says what it is and gives no medical advice.
MYTH CHECK	**Popular version:** Sleep paralysis is something supernatural or a sign of danger. **Documented:** It is a known sleep state: the muscle stillness of dream sleep briefly overlaps with waking.

Make it yours

3 swaps so it's your video

1. Open on a dark bedroom drawing instead of the text line.
2. Add a calm diagram of the sleep stages you made yourself.
3. Swap the CTA: ask viewers how long theirs lasted.

Ready to post

TITLE Awake but Can't Move? What Sleep Paralysis Is

DESCRIPTION What's happening when you wake up but can't move.

HASHTAGS #psychology #sleepparalysis #sleep

COVER TEXT Awake but can't move?

PIN If it happens often, talk to a doctor. This video isn't medical advice.

Do You Really Use Only 10% of Your Brain?

BEAT TIMELINE (SECONDS) · TOPIC: 10% OF THE BRAIN MYTH

0 3 9 16 23 30

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	The ten percent brain claim? It's a myth.	Brain outline with "10%" stamped, then crossed out	▸ Big card: MYTH	Confident
3–9	It's in movies and ads, but no known study found most of the brain sitting idle.	Movie-ticket and ad icons, generic and unbranded	‖ Pause after "ads"	Skeptical
9–16	Brain scans show activity across the whole brain over a day, even during sleep.	Brain outline lighting up in many areas	▸ New card: "whole brain"	Explaining
16–23	Damage to almost any area can cause problems. That wouldn't happen if most of it were spare.	Simple diagram: brain areas labeled by function	Highlight "almost any area"	Building
23–30 CTA	Your brain is busy, not ninety percent asleep. Which brain myth did you believe?	Busy brain icon with comment bubble	Hold question 1.5 s	Warm

VERIFY WITH	Lilienfeld et al. (2010), 50 Great Myths of Popular Psychology · Encyclopaedia Britannica: "brain"
EVIDENCE	**Did not replicate.** A myth with no study behind it; the voiceover calls it a myth, never a fact.
MYTH CHECK	**Popular version:** People use only 10% of their brains. **Documented:** Brain scans show activity across the whole brain, and damage to almost any area can cause problems.

Make it yours

3 swaps so it's your video

1. Open on a battery icon at 10% instead of the text.
2. Add a myth you believed as a kid as a second example.
3. Swap the CTA: ask viewers where they first heard the claim.

Ready to post

TITLE Do You Really Use Only 10% of Your Brain?

DESCRIPTION Why the famous 10% brain claim doesn't hold up.

HASHTAGS #psychology #brainmyths #mythbusting

COVER TEXT The 10% brain myth

PIN Where did you first hear the 10% claim?

Nobody Noticed Your Stain as Much as You Think

BEAT TIMELINE (SECONDS) · TOPIC: SPOTLIGHT EFFECT

0 3 9 16 23 30

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	You think everyone noticed. They mostly didn't.	Spotlight icon on a stick figure	▸ Big card: THEY DIDN'T NOTICE	Reassuring
3–9	This is the spotlight effect: we overestimate how much other people notice our looks and slips.	Crowd icons, most looking at their phones	‖ Pause after "spotlight effect"	Explaining
9–16	In a 2000 study, students walked into a room wearing an embarrassing T-shirt.	Simple drawing: door, plain T-shirt with a big "?"	▸ New card: "embarrassing T-shirt"	Storyteller
16–23	They guessed about half the room noticed it. In that study, only about a quarter actually did.	Two bars: guessed about half vs about a quarter	Highlight "about a quarter"	Reveal
23–30 CTA	You're the star of your own movie, not theirs. What moment still makes you cringe?	Movie clapperboard icon, comment bubble	Hold question 1.5 s	Warm

VERIFY WITH	Gilovich, Medvec & Savitsky (2000) · APA Dictionary of Psychology: "spotlight effect"
EVIDENCE	**Well supported.** Repeated in several studies; the numbers are rough figures from one classic study.
MYTH CHECK	No common myth.

Make it yours

3 swaps so it's your video

1. Open with your own small embarrassing moment as on-screen text.
2. Show a T-shirt icon you design yourself, not a real brand.
3. Swap the CTA: ask viewers what they assumed everyone saw.

Ready to post

TITLE Nobody Noticed Your Stain as Much as You Think

DESCRIPTION Why people notice your slips far less than you think.

HASHTAGS #psychology #spotlighteffect #confidence

COVER TEXT Nobody saw it (really)

PIN Tell me a moment you were sure everyone noticed.

Why You Forget Things When You Walk Through a Door

BEAT TIMELINE (SECONDS) · TOPIC: DOORWAY EFFECT

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	You walk into a room and forget why.	Simple drawing: person stops in a doorway, "?" above	▸ Big card: WHY AM I HERE?	Relatable
3–9	Some researchers think doorways act like event boundaries, so your brain files the last room away.	Animated folder closing as a door shuts	‖ Pause after "event boundaries"	Curious
9–16	In lab studies from 2006, walking through a doorway led to more forgetting than crossing one room.	Diagram: two rooms vs one long room	▸ New card: "more forgetting"	Explaining
16–23	But the effect is small, and later studies found it shows up only in some conditions.	Small bar labeled "small effect"	Highlight "some conditions"	Fair
23–30 CTA	Going back to the first room may help. What did you forget today?	Arrow leading back through the door	Hold question 1.5 s	Warm

VERIFY WITH	Radvansky & Copeland (2006) · Radvansky et al. (2011)
EVIDENCE	**Mixed.** The voiceover says the effect is small and appears only in some conditions.
MYTH CHECK	No common myth.

Make it yours

3 swaps so it's your video

1. Film your own doorway walk as the opening shot.
2. Add a quick on-screen list viewers must remember across the cut.
3. Swap the CTA: ask where viewers lose their train of thought.

Ready to post

TITLE Why You Forget Things When You Walk Through a Door

DESCRIPTION The doorway effect: real, but smaller than you'd think.

HASHTAGS #psychology #memory #doorwayeffect

COVER TEXT The door wiped your memory?

PIN What's the weirdest thing you walked into a room and forgot?

There's a Hole in Your Vision Right Now

BEAT TIMELINE (SECONDS) · TOPIC: BLIND SPOT

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	Each eye has a hole in its vision.	Eye outline with a small dark gap	▸ Big card: A HOLE?	Intriguing
3–9	Where the optic nerve leaves the back of the eye, there are no light-sensing cells at all.	Simple eye diagram, optic nerve labeled	‖ Pause after “at all”	Explaining
9–16	That's your blind spot. Your brain fills it in using the other eye and the surrounding scene.	Gap filling in with background pattern	▸ New card: “blind spot”	Explaining
16–23	Try it: close your left eye, stare at the cross, and move closer until the dot vanishes.	On-screen test: cross on left, dot on right	Hold test card 2 s	Playful
23–30 CTA	Your vision has edits you never notice. Did the dot disappear for you?	Same test card held for viewers	Hold question 1.5 s	Warm

VERIFY WITH	Encyclopaedia Britannica: “blind spot” · APA Dictionary of Psychology: “blind spot”
EVIDENCE	**Well supported.** Basic eye anatomy and textbook consensus; stated plainly.
MYTH CHECK	No common myth.

Make it yours

3 swaps so it’s your video

1. Draw your own cross-and-dot card and film it full screen.
2. Add a second test with a line that seems to continue.
3. Swap the CTA: ask at what distance the dot vanished.

Ready to post

TITLE There's a Hole in Your Vision Right Now

DESCRIPTION Find your blind spot in ten seconds.

HASHTAGS #psychology #blindspot #perception

COVER TEXT Find your blind spot

PIN At what distance did the dot vanish for you?

Why Teams Pull Less Than Their Members Do Alone

BEAT TIMELINE (SECONDS) · TOPIC: SOCIAL LOAFING

0 3 9 16 23 30

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	More people on the rope, less effort each.	Animated rope with stick figures added one by one	▸ Big card: LESS EFFORT EACH	Curious
3–9	Over a century ago, an engineer found teams pulled less than their members' solo efforts added up.	Bars: expected team total vs actual total	‖ Pause after "ago"	Storyteller
9–16	In 1979, psychologists asked people to clap and shout as loud as they could, alone or in groups.	Simple drawing: people clapping, sound waves	▸ New card: "alone or in groups"	Explaining
16–23	Each person made less noise in a group, even when they only believed others were shouting with them.	Headphones icon, sound meter dropping	Highlight "only believed"	Reveal
23–30 CTA	It's called social loafing. Have you carried a group project alone?	Group chat mockup, one name doing tasks	Hold question 1.5 s	Playful

VERIFY WITH	Latané, Williams & Harkins (1979) · APA Dictionary of Psychology: "social loafing"
EVIDENCE	**Well supported.** Found in many group tasks; the voiceover describes a tendency, not a rule.
MYTH CHECK	No common myth.

Make it yours

3 swaps so it's your video

1. Open on a tug-of-war drawing instead of the rope line.
2. Show your own group-chat example of how work got split.
3. Swap the CTA: ask how viewers make group work fair.

Ready to post

TITLE Why Teams Pull Less Than Their Members Do Alone

DESCRIPTION Why people put in less effort when the work is shared.

HASHTAGS #psychology #socialloafing #teamwork

Why One Bad Comment Outweighs Ten Nice Ones

BEAT TIMELINE (SECONDS) · TOPIC: NEGATIVITY BIAS

0 3 9 16 23 30

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	Ten nice comments. One mean one. Guess which sticks?	Mock comment list: ten hearts, one red comment	▸ Big card: WHICH ONE STICKS?	Relatable
3–9	Psychologists call it negativity bias: bad events tend to grab more attention and weight than good ones.	Scale tipping toward a small dark weight	‖ Pause after “negativity bias”	Explaining
9–16	A well-known 2001 review gathered findings across relationships, feedback and memory pointing the same way.	Stack of paper icons labeled with topics	▸ New card per area	Steady
16–23	One idea is that noticing threats helped our ancestors survive, but that part is a theory.	Simple campfire drawing with a “theory” label	Highlight “a theory”	Careful
23–30 CTA	Knowing the bias can help you weigh feedback fairly. Which comment still lives in your head?	Comment bubble icons, one glowing	Hold question 1.5 s	Warm

VERIFY WITH	Baumeister et al. (2001), “Bad is stronger than good” · Rozin & Royzman (2001)
EVIDENCE	**Well supported.** Supported by many studies and two major reviews; the evolution part is labeled a theory.
MYTH CHECK	No common myth.

Make it yours

3 swaps so it’s your video

1. Open with a fake comment section you write yourself.
2. Add your own example: one bad review after a good week.
3. Swap the CTA: ask for the nicest comment viewers ever got.

COVER TEXT Your eyes move when you dream

PIN Describe last night's dream in five words.

Will Mozart Make Your Baby Smarter? Not Really

BEAT TIMELINE (SECONDS) · TOPIC: MOZART EFFECT

0 3 10 18 27 36 45

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	Mozart for babies? The study wasn't even about babies.	Baby-mobile icon with music notes, then a "?"	▸ Big card: NOT ABOUT BABIES	Skeptical
3–10	In 1993, college students who listened to a Mozart sonata did slightly better on a spatial puzzle task.	Simple paper-folding puzzle diagram	‖ Pause after "sonata"	Storyteller
10–18	The boost was small and lasted only around ten to fifteen minutes. It didn't measure general intelligence.	Timer icon: ten to fifteen minutes	Highlight "small"	Fair
18–27	Still, the idea spread fast, and products promising smarter babies followed.	Generic unbranded product boxes with music notes	▸ New card: "smarter babies"	Wry
27–36	Other labs struggled to repeat it, and big reviews found the effect small at best, maybe just extra alertness.	Bar chart: original bar tall, repeats small	‖ Pause 0.5 s after "repeat it"	Reveal
36–45 CTA	Play music because you enjoy it, not as a brain upgrade. What song gets you focused?	Headphones icon, comment bubble	Hold question 1.5 s	Warm

VERIFY WITH	Rauscher, Shaw & Ky (1993) · Chabris (1999) · Lilienfeld et al. (2010)
EVIDENCE	**Did not replicate.** Presented as a claim that failed to hold up in repeat studies; never stated as fact.
MYTH CHECK	**Popular version:** Listening to Mozart makes babies and children smarter. **Documented:** The 1993 study tested college students on one spatial task for minutes; repeat studies found a small effect at best.

Make it yours

3 swaps so it's your video

1. Open on a baby-mobile icon playing notes, no real baby footage.
2. Use public-domain classical music you recorded or licensed.
3. Swap the CTA: ask what music viewers study to.

TITLE The 2-4-6 Puzzle That Exposes Confirmation Bias

DESCRIPTION A simple number game that shows how we test our ideas.

HASHTAGS #psychology #confirmationbias #puzzle

COVER TEXT Guess my rule: 2, 4, 6

PIN Comment your guess for the rule before watching the end.

Why Cramming Fades and Spaced Study Sticks

BEAT TIMELINE (SECONDS) · TOPIC: SPACING EFFECT

0 3 10 18 27 36 45

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	Cramming works. For about a day.	Clock at 3 a.m., open book, coffee cup	▸ Big card: FOR ABOUT A DAY	Wry
3–10	In the 1880s, a German researcher memorized lists of nonsense syllables to measure how fast he forgot.	Notebook with nonsense syllables like “DAX” and “BOK”	‖ Pause after “nonsense syllables”	Storyteller
10–18	He found forgetting is steep at first, then slows down. That curve is now called the forgetting curve.	Forgetting curve drawing, steep then flat	▸ New card: “forgetting curve”	Explaining
18–27	He also noticed that spreading practice over several days took fewer total repetitions than packing it into one sitting.	Calendar: one crammed day vs several spaced days	Highlight “fewer total repetitions”	Building
27–36	That's the spacing effect, and a large 2006 review of hundreds of studies backed it up.	Stack of paper icons labeled “hundreds of studies”	▸ New card: “spacing effect”	Confident
36–45 CTA	Same hours, spread out, tend to last longer. What are you cramming for right now?	Two curves: cram fades, spaced stays higher	Hold question 1.5 s	Warm

VERIFY WITH	Ebbinghaus (1885) · Cepeda et al. (2006) · APA Dictionary of Psychology: “spacing effect”
EVIDENCE	**Well supported.** Replicated across hundreds of studies; the voiceover still says “tend to”.
MYTH CHECK	No common myth.

Make it yours

3 swaps so it’s your video

1. Show your own study calendar with spaced review days marked.
2. Open on a melting ice cube for the forgetting curve.
3. Swap the CTA: ask viewers what they're learning this month.

Ready to post

TITLE Why Cramming Fades and Spaced Study Sticks

DESCRIPTION Why spreading out study time beats one long cram.

HASHTAGS #psychology #studytips #spacingeffect

Two Equal Lines Your Eyes Refuse to Believe

BEAT TIMELINE (SECONDS) · TOPIC: MÜLLER-LYER ILLUSION

0 3 10 18 27 36 45

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	Which line is longer? Look closely.	Optical-illusion graphic: two lines with arrow fins	▸ Big card: WHICH IS LONGER?	Playful
3–10	They're the same length. This is the Müller-Lyer illusion, first published in 1889.	Ruler slides in, lines shown equal	‖ Pause after “same length”	Reveal
10–18	The only difference is the arrow tips: fins pointing outward make a line look longer, fins pointing inward make it shorter.	Fins highlighted: outward vs inward	▸ New card per fin type	Explaining
18–27	Even when you know the trick, the illusion doesn't go away. Knowing and seeing are handled differently.	Ruler removed, illusion returns	Highlight “doesn’t go away”	Intrigued
27–36	Why it happens is still debated. One idea is that the fins look like corners of rooms and buildings, which hint at distance.	Simple drawing: room corner and building corner	Highlight “still debated”	Fair
36–45 CTA	Measure the lines yourself. Did your eyes or your ruler win?	Ruler on screen, comment bubble	Hold question 1.5 s	Playful

VERIFY WITH	Müller-Lyer (1889) · APA Dictionary of Psychology: “Müller-Lyer illusion”
EVIDENCE	**Well supported.** The illusion itself is robust; the voiceover marks the explanation as still debated.
MYTH CHECK	No common myth.

Make it yours

3 swaps so it’s your video

1. Draw the lines yourself and measure them on camera.
2. Add a second illusion you make in any graphics app.
3. Swap the CTA: ask viewers to guess the length difference.

COVER TEXT Same length. Seriously.

PIN Measure them on your screen and report back.

Would You Help if Others Were Watching?

BEAT TIMELINE (SECONDS) · TOPIC: BYSTANDER EFFECT

0 3 10 18 27 36 45

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	More people watching can mean less help. Sometimes.	Crowd of simple figures, one hand raised	▸ Big card: LESS HELP?	Serious
3–10	In a 1968 study, students talked over an intercom and heard another student seem to have a seizure.	Intercom icon with sound waves	‖ Pause after “seizure”	Storyteller
10–18	Students who thought they were the only listener helped far more often, and faster, than those who thought others were listening too.	Two bars: alone helped more vs group	Highlight “far more often”	Reveal
18–27	This is the bystander effect. One explanation is diffusion of responsibility: each person assumes someone else will act.	Responsibility arrow splitting among figures	▸ New card: “diffusion of responsibility”	Explaining
27–36	But a 2020 study of real street-camera footage found that someone stepped in during most public conflicts.	Street-camera icon, many hands reaching in	Highlight “someone stepped in”	Hopeful
36–45 CTA	The lab effect is real, but crowds aren't hopeless. Would you step in first?	One figure stepping forward, comment bubble	Hold question 1.5 s	Warm

VERIFY WITH	Darley & Latané (1968) · Philpot et al. (2020), street-camera study
EVIDENCE	**Mixed.** The voiceover says the lab effect is real but that real-world bystanders often do help.
MYTH CHECK	**Popular version:** In a crowd, nobody helps. **Documented:** In the lab, more listeners meant slower help, but real street-camera footage showed someone usually stepped in.

Make it yours

3 swaps so it’s your video

1. Open on a drawing of a crowd, one figure stepping forward.
2. Add your own tip: point at one person and ask them directly.
3. Swap the CTA: ask viewers about a time a stranger helped them.

Ready to post

Can You Really Hold Seven Things in Mind?

BEAT TIMELINE (SECONDS) · TOPIC: SHORT-TERM MEMORY CAPACITY (7 ± 2)

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	Seven, plus or minus two. Maybe fewer.	Big number 7 with ± 2, then a "?"	▸ Big card: SEVEN?	Curious
3–10	In 1956, a famous paper noted people can hold about seven items in mind, give or take two.	Seven dots in a row, two fading	‖ Pause after "give or take two"	Storyteller
10–18	That paper also described chunking: grouping items so 1-9-1-4 becomes one year, 1914, instead of four digits.	Digits 1 9 1 4 snapping into "1914"	▸ New card: "1914"	Explaining
18–27	Later researchers argued the true limit is smaller. A 2001 review put it closer to four chunks.	Four boxes labeled "chunks"	Highlight "closer to four"	Reveal
27–36	The exact number is still debated, and it depends on what you're remembering and whether you can rehearse.	Scale with "words", "digits", "faces" weights	Highlight "still debated"	Fair
36–45 CTA	Either way, chunking helps: phone numbers come in groups for a reason. How many digits can you hold?	Phone number split into groups	Hold question 1.5 s	Playful

VERIFY WITH	Miller (1956) · Cowan (2001) · APA Dictionary of Psychology: "chunking"
EVIDENCE	**Mixed.** Limited capacity is well supported; the voiceover says the exact number is debated.
MYTH CHECK	**Popular version:** Everyone can hold exactly seven things in short-term memory. **Documented:** Seven was a rough figure; later work suggests about four chunks, and the number depends on the material.

Make it yours

3 swaps so it's your video

1. Open with a digit test: flash seven digits for three seconds.
2. Use a grocery list of your own as the chunking example.
3. Swap the CTA: ask viewers how many digits they recalled.

Ready to post

TITLE Can You Really Hold Seven Things in Mind?

The Dunning-Kruger Effect Isn't What the Memes Say

BEAT TIMELINE (SECONDS) · TOPIC: DUNNING-KRUGER EFFECT

0 3 10 18 27 36 45 54 60

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	The Dunning-Kruger meme? The study said something different.	Meme-style confidence curve, then a "?" stamp	▸ Big card: NOT WHAT YOU THINK	Teasing
3–10	In 1999, students took tests of logic, grammar and humor, then guessed how well they'd done compared with others.	Test paper icons: logic, grammar, humor	‖ Pause after "compared with others"	Storyteller
10–18	The lowest scorers overestimated themselves the most. On average they placed themselves above the middle, while scoring near the bottom.	Two bars per group: actual vs self-estimate	Highlight "near the bottom"	Reveal
18–27	Top scorers, meanwhile, slightly underestimated how they compared. That pattern became famous as the Dunning-Kruger effect.	Top group bars: estimate slightly below actual	▸ New card: "Dunning-Kruger effect"	Explaining
27–36	But the memes exaggerate it. Low scorers didn't think they were experts. They still rated themselves lower than top scorers rated themselves.	Bottom group's estimate bar below top group's	Highlight "the memes exaggerate"	Fair
36–45	And some researchers argue part of the pattern is a statistical artifact: noisy self-ratings plus a common habit of feeling above average.	Scatter dots pulling toward the middle line	▸ New card: "statistical artifact"	Careful
45–54	So the effect is real but debated in size. It's not proof that people who disagree with you are clueless.	Scale: real effect, debated size	‖ Pause 0.5 s after "size"	Calm
54–60 CTA	Where do you think you overrate yourself? Be honest below.	Comment bubble with a mirror icon	Hold question 1.5 s	Warm

VERIFY WITH	Kruger & Dunning (1999) · APA Dictionary of Psychology: "Dunning–Kruger effect"
EVIDENCE	**Mixed.** The voiceover says the effect is real but debated in size, with a possible statistical artifact.
MYTH CHECK	**Popular version:** The least skilled people think they're experts. **Documented:** Low scorers overestimated but still rated themselves below top scorers; part may be a statistical artifact.

One Word Changed What Witnesses Remembered

BEAT TIMELINE (SECONDS) · TOPIC: MISINFORMATION EFFECT

0 3 10 18 27 36 45 54 60

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	One word changed what people remembered seeing.	Two speech bubbles: “hit” and “smashed”	▸ Big card: ONE WORD	Intriguing
3–10	In a 1974 study, students watched short films of car crashes, then answered questions about them.	Simple animated toy cars bumping, no injuries	‖ Pause after “questions about them”	Storyteller
10–18	One group was asked how fast the cars were going when they 'hit' each other. Another heard 'smashed.'	Question card with the verb swapping	▸ New card per verb	Building
18–27	Same film, but the 'smashed' group gave higher speed estimates on average than the 'hit' group.	Speedometer needle higher for “smashed”	Highlight “higher speed estimates”	Reveal
27–36	A week later, they were asked if they'd seen broken glass. There was none in the film.	Calendar flips one week, glass icon with “?”	‖ Pause after “broken glass”	Building
36–45	People who heard 'smashed' were more likely to say yes. The question seemed to have changed the memory itself.	Bar: more “yes” answers in the smashed group	Highlight “more likely”	Reveal
45–54	This is the misinformation effect. Memory isn't a recording. It's rebuilt each time, and new details can slip in.	Memory puzzle rebuilding with a new piece	▸ New card: “misinformation effect”	Explaining
54–60 CTA	Have you ever remembered something that turned out wrong?	Comment bubble with a puzzle piece	Hold question 1.5 s	Warm

VERIFY WITH	Loftus & Palmer (1974) · APA Dictionary of Psychology: “misinformation effect”
EVIDENCE	**Well supported.** A textbook finding repeated in many studies; the voiceover says “seemed to” about memory change.
MYTH CHECK	**Popular version:** Memory works like a video recording you can replay. **Documented:** Memory is rebuilt when recalled, and wording or later information can add details that were never there.

Make it yours

3 swaps so it’s your video

1. Open on two speech bubbles: “hit” vs “smashed”.
2. Add your own family story that everyone remembers differently.
3. Swap the CTA: ask viewers to describe a memory that proved false.

Same Facts, Different Words, Opposite Choices

BEAT TIMELINE (SECONDS) · TOPIC: FRAMING EFFECT

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	Same facts, different words, opposite choice.	Two cards: "200 saved" and "400 die"	▸ Big card: SAME FACTS?	Intriguing
3–10	In 1981, two researchers asked people to imagine a disease outbreak expected to cost six hundred lives.	Simple map icon with a warning symbol, number 600	‖ Pause after "six hundred lives"	Storyteller
10–18	One group chose between plans described as lives saved: two hundred saved for sure, or a one-in-three chance to save everyone.	Card A: sure save vs dice with 1/3	▸ New card: "saved for sure"	Explaining
18–27	Most picked the sure thing. Another group saw the same plans described as lives lost: four hundred die for sure, or the gamble.	Same cards relabeled in red loss wording	Highlight "lives lost"	Building
27–36	Now most picked the gamble. The outcomes were identical. Only the wording changed.	Equals sign between the two card pairs	Highlight "identical"	Reveal
36–45	This is the framing effect. Framed as gains, we tend to play safe; framed as losses, we gamble more.	Two arrows: safe path vs gamble path	▸ New card: "framing effect"	Explaining
45–54	You see it in ads too: ninety percent fat-free sounds better than ten percent fat.	Generic food label with two wordings	Highlight "fat-free"	Playful
54–60 CTA	Which version would you have picked: safe, or the gamble?	Two buttons: SAFE and GAMBLE	Hold question 1.5 s	Warm

VERIFY WITH	Tversky & Kahneman (1981) · APA Dictionary of Psychology: "framing effect"
EVIDENCE	**Well supported.** A classic finding repeated in many studies; the voiceover says "tend to".
MYTH CHECK	No common myth.

Make it yours

3 swaps so it's your video

1. Open on two signs with the same number framed two ways.
2. Use a product label you design: "90% fat-free" vs "10% fat".
3. Swap the CTA: ask viewers to spot a framed ad this week.

COVER TEXT Same facts, opposite choice

PIN Spot a framed ad this week? Share the wording.

Do Smiles Mean the Same Thing Everywhere?

BEAT TIMELINE (SECONDS) · TOPIC: UNIVERSAL FACIAL EXPRESSIONS

0 3 10 18 27 36 45 54 60

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	Is a smile the same in every culture?	Simple smiley drawing with a globe icon	▸ Big card: SAME SMILE?	Curious
3–10	In the 1960s and 70s, researchers showed photos of facial expressions to people in many countries.	Grid of simple drawn faces, no real photos	‖ Pause after “many countries”	Storyteller
10–18	In a 1971 study, people in a remote community in Papua New Guinea matched faces to short stories, like a friend arriving.	Map outline, story card with a face to match	▸ New card: “a friend arriving”	Storyteller
18–27	They often matched them the way Westerners did, which suggested some basic expressions might be universal.	Matching lines between faces and story cards	Highlight “might be universal”	Building
27–36	That idea became textbook material: happiness, sadness, fear, anger, surprise and disgust, read the same everywhere.	Six simple drawn faces labeled by emotion	▸ New card per emotion	Neutral
36–45	But later work found the picture is messier. Accuracy drops when people get no list of emotion words to choose from.	Answer list fading away, accuracy bar drops	Highlight “messier”	Fair
45–54	A large 2019 review argued people don't reliably show or read emotions from faces alone. Context matters a lot.	Same face drawing, two different background scenes	Highlight “Context matters”	Careful
54–60 CTA	So some overlap, plenty of debate. Can you read your friends' faces without context?	Face drawing with a question bubble	Hold question 1.5 s	Warm

VERIFY WITH	Ekman & Friesen (1971) · Barrett et al. (2019), review · APA Dictionary of Psychology: “facial expression”
EVIDENCE	**Mixed.** The voiceover presents universality as one side of an open debate, not as settled fact.
MYTH CHECK	**Popular version:** Six basic facial expressions are read the same way by everyone, everywhere. **Documented:** Early studies found some agreement across cultures, but later reviews found reading faces depends heavily on context.

Make it yours

3 swaps so it’s your video

1. Draw six simple emoji-style faces yourself for beat 5.
2. Add a context test: same face, two different captions.
3. Swap the CTA: ask which emotion viewers find hardest to read.

Ready to post

TITLE Do Smiles Mean the Same Thing Everywhere?

DESCRIPTION The classic universal-faces study and the debate it started.

HASHTAGS #psychology #emotions #facialexpressions

COVER TEXT Is a smile universal?

How a Sleep Lab Confirmed Lucid Dreams

BEAT TIMELINE (SECONDS) · TOPIC: LUCID DREAMING

0 3 10 18 27 36 45 54 60

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	Can you know you're dreaming, inside the dream?	Dream cloud with a lightbulb inside	▸ Big card: AWARE IN A DREAM?	Intriguing
3–10	That's called lucid dreaming. For a long time, many scientists doubted it, because dream reports come after waking.	Doubtful face icon next to a dream report	‖ Pause after “lucid dreaming”	Explaining
10–18	Maybe people were just awake and imagining, or remembering wrongly. How do you test a dream from the inside?	Two thought bubbles: awake vs asleep, “?”	‖ Pause after the question	Curious
18–27	Here's the trick: your eye movements in dream sleep can follow where you look in the dream.	Eye icon tracking a dot inside a dream cloud	▸ New card: “eye movements”	Reveal
27–36	In early 1980s studies, sleepers agreed on a signal before bed: look left, right, left, right once they knew they were dreaming.	Arrows: left, right, left, right	▸ New card per direction	Storyteller
36–45	Lab equipment showed them in dream sleep, and the agreed eye signal appeared right on cue.	Signal trace with the eye pattern highlighted	Highlight “right on cue”	Reveal
45–54	That's how lucid dreaming was confirmed in the lab. Many people report having one at least once.	Lab checklist with a green tick	Highlight “confirmed”	Confident
54–60 CTA	Have you ever realized you were dreaming?	Dream cloud with a comment bubble	Hold question 1.5 s	Warm

VERIFY WITH	LaBerge et al. (1981) · APA Dictionary of Psychology: “lucid dream”
EVIDENCE	**Well supported.** Confirmed in sleep labs with eye signals; the voiceover says “many people report”.
MYTH CHECK	**Popular version:** Lucid dreams are made up, since nobody can be aware inside a dream. **Documented:** Sleep-lab studies recorded pre-agreed eye signals from people in verified dream sleep.

Make it yours

3 swaps so it's your video

1. Open on a closed-eye drawing with arrows: left, right, left, right.
2. Add your own dream-journal entry as on-screen text.
3. Swap the CTA: ask what viewers did in their first lucid dream.

Ready to post

DESCRIPTION The clever eye-signal test that confirmed lucid dreaming.

HASHTAGS #psychology #luciddreaming #dreams

COVER TEXT Aware inside a dream

PIN What's the first thing you'd do in a lucid dream?

Willpower Isn't a Battery (Probably)

BEAT TIMELINE (SECONDS) · TOPIC: EGO DEPLETION

0 3 10 18 27 36 45 54 60

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	You've heard willpower runs out like a battery.	Animated battery icon draining to red	▸ Big card: "BATTERY?"	Curious
3–10	The idea is called ego depletion, and it started with a famous 1998 study.	Old journal icon with a "1998" label	‖ Pause after "ego depletion"	Storyteller
10–18	People told to eat radishes instead of nearby cookies gave up sooner on an impossible puzzle afterward.	Simple drawing: radish plate vs cookie plate	▸ New card per plate	Storyteller
18–27	Hundreds of follow-up studies seemed to agree, and the battery idea spread into self-help books and productivity advice.	Stack of book icons growing	▸ New card per clause	Building
27–36	Then labs tried something stricter. In 2016, one project ran a standard version in over twenty labs at once.	Diagram: many lab icons light up together	Highlight "over twenty labs"	Serious
36–45	The result? An effect close to zero. A later multi-lab project also found, at most, a very small effect.	Bar chart: tall original bar, tiny repeat bar	‖ Pause after "The result?"	Reveal
45–54	Feeling tired is real. What didn't hold up is the simple fuel-tank story, and giving up likely has many causes.	Fuel-gauge icon with a question mark	Highlight "didn't hold up"	Fair
54–60 CTA	Do you think willpower runs out? Tell me in the comments.	Battery icon + comment bubble	Hold last card 1.5 s	Warm

VERIFY WITH	Baumeister et al. (1998) · Hagger et al. (2016), multi-lab replication · APA Dictionary of Psychology: "ego depletion"
EVIDENCE	**Did not replicate.** The voiceover presents the battery idea as a claim that failed, never as fact.
MYTH CHECK	**Popular version:** Willpower is a fixed fuel that every act of self-control uses up. **Documented:** A large multi-lab replication found an effect near zero; a later one found at most a very small effect.

Make it yours

3 swaps so it's your video

1. Open on the radish-vs-cookie plates instead of the battery.
2. Add your own example: skipping the gym after a long workday.
3. Swap the CTA: ask which brain fact viewers stopped believing.

Ready to post

TITLE Willpower Isn't a Battery (Probably)

DESCRIPTION Why the famous ego-depletion finding is now in doubt.

HASHTAGS #psychology #willpower #replication

COVER TEXT Willpower battery? Not so fast.

Why You 'Knew It All Along' (You Didn't)

BEAT TIMELINE (SECONDS) · TOPIC: HINDSIGHT BIAS

0 3 10 18 27 36 45 54 60

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	You knew it all along? Probably not.	Crystal ball icon with a "?" stamp	▸ Big card: KNEW IT ALL ALONG?	Teasing
3–10	Hindsight bias is the feeling, after something happens, that it was obvious and you saw it coming.	Timeline: event happens, arrow loops backward	‖ Pause after "saw it coming"	Explaining
10–18	In a 1975 study, people read about a historical battle. Some were told how it ended, others weren't.	Old map icon, two outcome cards	▸ New card: "how it ended"	Storyteller
18–27	Those told an outcome rated it as more likely, whichever outcome they were told.	Likelihood bars rising for the told outcome	Highlight "more likely"	Reveal
27–36	Worse, they tended to think they'd have predicted it anyway, and that others would have too.	Thought bubble: "I knew it"	Highlight "predicted it anyway"	Wry
36–45	Other studies found people misremember their own earlier predictions, shifting them toward what actually happened.	Prediction note being rewritten with an eraser	▸ New card: "misremember"	Explaining
45–54	That makes it hard to learn from surprises. Writing predictions down before the result is one simple check.	Sealed envelope labeled "prediction"	Highlight "Writing predictions down"	Practical
54–60 CTA	What result did you swear you saw coming? Tell me in the comments.	Notebook icon, comment bubble	Hold question 1.5 s	Warm

VERIFY WITH	Fischhoff (1975) · Fischhoff & Beyth (1975) · APA Dictionary of Psychology: "hindsight bias"
EVIDENCE	**Well supported.** Replicated across many tasks; the voiceover says "tended to" for the classic results.
MYTH CHECK	No common myth.

Make it yours

3 swaps so it's your video

1. Open on a sports score you predicted wrongly, written on paper.
2. Show your own prediction notebook as the check in beat 7.
3. Swap the CTA: ask viewers to post a prediction and revisit later.

The Obedience Study: What It Really Showed

BEAT TIMELINE (SECONDS) · TOPIC: MILGRAM OBEDIENCE STUDY

0 3 10 18 27 36 45 54 60

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	Would you follow orders you thought were hurting someone?	Simple dial graphic with a hand hovering	▸ Big card: WOULD YOU?	Serious
3–10	In a 1963 study, volunteers were told to give a learner electric shocks for each wrong answer.	Two desks, a wall between them, intercom icon	‖ Pause after “wrong answer”	Storyteller
10–18	The shocks weren't real, and the learner was an actor. But the volunteers believed the shocks were getting stronger.	Dial graphic with an “actor” label on the far side	Highlight “weren't real”	Calm
18–27	When volunteers hesitated, a researcher calmly told them to continue. In the best-known version, about two in three went to the highest level.	Pie chart: about two in three	Highlight “about two in three”	Serious
27–36	Many were visibly stressed and argued, which is part of why the study is now seen as an ethics lesson too.	Worried face icon, ethics checklist	▸ New card: “ethics lesson”	Careful
36–45	But across later versions, obedience rates varied a lot, dropping sharply when the researcher gave orders by phone, for example.	Bar chart: rates across versions, phone version low	Highlight “varied a lot”	Fair
45–54	A partial repeat in 2009 found similar rates. What it all means about people is still debated.	Two bars: 1963 vs 2009, question mark	Highlight “still debated”	Fair
54–60 CTA	What do you think would make you stop?	Stop sign icon, comment bubble	Hold question 1.5 s	Warm

VERIFY WITH	Milgram (1963) · Burger (2009), partial replication · APA Dictionary of Psychology: “obedience”
EVIDENCE	**Mixed.** The voiceover gives the classic rate, then says rates varied and the meaning is still debated.
MYTH CHECK	**Popular version:** Almost everyone will obey orders to hurt someone. **Documented:** About two in three obeyed fully in the best-known version, but rates varied widely across versions and settings.

Make it yours

3 swaps so it's your video

1. Use a simple dial graphic you draw instead of any archive footage.
2. Add your own example of following a rule you disagreed with.
3. Swap the CTA: ask what makes viewers push back on authority.

Ready to post

Do Losses Really Hurt Twice as Much as Gains?

BEAT TIMELINE (SECONDS) · TOPIC: LOSS AVERSION

0 3 10 18 27 36 45 54 60

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	Losses sting more than gains please. But how much?	Plus and minus icons on a seesaw, minus heavier	▸ Big card: HOW MUCH WORSE?	Curious
3–10	Picture a coin flip where tails costs you a set amount. How much would heads need to pay?	Coin icon flipping: heads plus, tails minus	‖ Pause after “set amount”	Playful
10–18	In studies like this, many people turn the bet down unless the possible win is far bigger than the possible loss.	Seesaw: small win side rejected, big win accepted	Highlight “far bigger”	Explaining
18–27	In 1979, two psychologists built this into prospect theory. It's called loss aversion: a loss tends to weigh more than an equal gain.	Curve graph: steeper on the loss side	▸ New card: “loss aversion”	Explaining
27–36	You'll often hear that losses hurt about twice as much. That number came from some early estimates, not a law of nature.	Text “2x” stamped, then “about?”	Highlight “not a law of nature”	Skeptical
36–45	Later studies found the size changes a lot with the stakes, the situation and how the choice is asked.	Dial labeled “size” turning with stakes	Highlight “changes a lot”	Fair
45–54	Some researchers even argue that for small amounts, losses and gains can feel about equal. The debate is ongoing.	Two even weights on the seesaw, small coins	Highlight “ongoing”	Fair
54–60 CTA	Do losses sting more for you than wins feel good?	Seesaw icon, comment bubble	Hold question 1.5 s	Warm

VERIFY WITH	Kahneman & Tversky (1979), prospect theory · APA Dictionary of Psychology: “loss aversion”
EVIDENCE	**Mixed.** The voiceover says losses tend to weigh more, but the size is debated and varies.
MYTH CHECK	**Popular version:** Losses always hurt exactly twice as much as gains feel good. **Documented:** Losses tend to weigh more, but how much varies with stakes and situation, and it's disputed for small amounts.

PIN What small loss still bugs you years later?

Does a Big Windfall Make You Happier for Good?

BEAT TIMELINE (SECONDS) · TOPIC: HEDONIC ADAPTATION

0 3 10 18 27 36 45 54 60

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	Does a huge windfall make you happier for good?	Confetti graphic slowly fading to grey	▸ Big card: HAPPIER FOR GOOD?	Curious
3–10	Hedonic adaptation is the idea that after big changes, our mood tends to drift back toward its usual level.	Mood line rising, then drifting back to baseline	‖ Pause after “usual level”	Explaining
10–18	A famous 1978 study compared a small group of lottery winners with people who hadn't won.	Two small groups of figure icons	▸ New card: “a small group”	Storyteller
18–27	The winners weren't much happier, and they enjoyed everyday pleasures a little less. That result became famous.	Two mood meters nearly level	Highlight “weren't much happier”	Reveal
27–36	But that group was small. A large 2020 study of thousands of winners in Sweden found big wins raised life satisfaction for years.	Large crowd of icons, satisfaction bar staying up	Highlight “for years”	Building
36–45	Interestingly, day-to-day happiness and mood changed much less than overall life satisfaction did.	Two bars: life satisfaction up, daily mood flat	Highlight “much less”	Thoughtful
45–54	So adaptation is real, but it isn't the whole story. It depends on what changed and what you measure.	Scale balancing two labels: “adapt” and “lasting”	▸ New card: “not the whole story”	Fair
54–60 CTA	What exciting change wore off fastest for you?	Calendar icon, comment bubble	Hold question 1.5 s	Warm

VERIFY WITH	Brickman, Coates & Janoff-Bulman (1978) · Lindqvist, Östling & Cesarini (2020)
EVIDENCE	**Mixed.** The voiceover contrasts a small classic study with a larger later one; the picture is mixed.
MYTH CHECK	**Popular version:** Lottery winners end up no happier than anyone else. **Documented:** One small 1978 study suggested that, but a large 2020 study found big wins raised life satisfaction for years.

Why Sleeping After Studying Helps You Remember

BEAT TIMELINE (SECONDS) · TOPIC: SLEEP AND MEMORY CONSOLIDATION

0 3 10 18 27 36 45 54 60

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	Study, then sleep. Your memory may thank you.	Book resting on a pillow, moon icon	▸ Big card: STUDY, THEN SLEEP	Calm
3–10	In 1924, two psychologists had people learn nonsense syllables, then tested them hours later.	Notebook with nonsense syllables, 1924 label	‖ Pause after “hours later”	Storyteller
10–18	Sometimes those hours were spent asleep. Other times, awake and going about a normal day.	Split screen: moon side vs sun side	▸ New card per condition	Explaining
18–27	After the same amount of time, they remembered more when they had slept. It was a tiny study, with just two participants.	Two bars: slept higher, awake lower, “n = 2”	Highlight “just two participants”	Reveal
27–36	Their idea was that being awake fills the day with new input that interferes with what you just learned.	New icons crowding over a fresh memory	Highlight “interferes”	Explaining
36–45	Since then, many studies have backed the basic finding, and sleep now seems to do more than just protect memories.	Stack of study icons growing	Highlight “basic finding”	Building
45–54	During deep sleep, the brain appears to replay and strengthen new memories, a process called consolidation.	Brain icon replaying a short film strip	▸ New card: “consolidation”	Calm
54–60 CTA	So an all-nighter may cost you more than sleep. When do you usually study?	Moon icon, comment bubble	Hold question 1.5 s	Warm

VERIFY WITH	Jenkins & Dallenbach (1924) · APA Dictionary of Psychology: “consolidation”
EVIDENCE	**Well supported.** The basic finding is well supported; the voiceover flags the tiny original study and says “appears to”.
MYTH CHECK	No common myth.

Make it yours

3 swaps so it’s your video

1. Open on a drawing of a book resting on a pillow.
2. Show your own study-then-sleep plan for an upcoming test.
3. Swap the CTA: ask viewers about their worst all-nighter.

The Marshmallow Test Predicted Less Than You Heard

BEAT TIMELINE (SECONDS) · TOPIC: MARSHMALLOW TEST (DELAY OF GRATIFICATION)

0 3 10 18 27 36 45 54 60

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	One marshmallow now, or two if you wait?	Two marshmallow icons and a kitchen timer	▸ Big card: NOW OR LATER?	Playful
3–10	In studies at a university preschool starting around 1970, kids could eat one treat now or wait for two.	Simple drawing: child, plate, bell on a table	‖ Pause after “wait for two”	Storyteller
10–18	Years later, follow-ups found kids who waited longer tended to have better test scores and other outcomes.	Arrow from timer to graduation-cap icon	Highlight “tended to”	Building
18–27	That became a famous lesson: teach kids to wait and they'll succeed. But the original follow-up samples were small and not very diverse.	Small group of icons, all alike	Highlight “small”	Fair
27–36	In 2018, researchers repeated the idea with a much larger, more varied group of children.	Large mixed group of icons	▸ New card: “much larger”	Explaining
36–45	The link with later achievement was about half as strong, and it shrank a lot once family background was taken into account.	Bar halving, then shrinking further	Highlight “about half as strong”	Reveal
45–54	So waiting may partly reflect a child's circumstances, not just willpower. The test still says something, just less.	Timer icon next to a house icon	Highlight “circumstances”	Thoughtful
54–60 CTA	Would you have waited for the second treat?	Marshmallow icons, comment bubble	Hold question 1.5 s	Warm

VERIFY WITH	Shoda, Mischel & Peake (1990) · Watts, Duncan & Quan (2018), conceptual replication
EVIDENCE	**Mixed.** The voiceover says the link is real but smaller than claimed and shaped by background.
MYTH CHECK	**Popular version:** Kids who wait for the second marshmallow are set up for success. **Documented:** A larger 2018 study found the link about half as strong, and much smaller once family background was considered.

Make it yours

3 swaps so it’s your video

1. Draw two marshmallows and a timer yourself for beat 1.
2. Add your own childhood example of waiting for a treat.
3. Swap the CTA: ask what viewers think waiting really measures.

COVER TEXT Marshmallows predict less

PIN Would you have waited? Be honest.

Why We Blame Character and Miss the Situation

BEAT TIMELINE (SECONDS) · TOPIC: FUNDAMENTAL ATTRIBUTION ERROR

0 3 10 18 27 36 45 54 60

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	They're late, so they must be careless?	Clock icon, figure running late	▸ Big card: CARELESS?	Teasing
3–10	Blaming someone's character and overlooking their situation has a name: the fundamental attribution error.	Two arrows: character vs situation, one bolded	‖ Pause after "attribution error"	Explaining
10–18	In a 1967 study, students read essays either for or against a controversial foreign leader.	Two essay sheets: "for" and "against"	▸ New card: "for or against"	Storyteller
18–27	Some were told the writers chose their side. Others were told the writers had been assigned a side.	Coin-toss icon labeled "assigned"	Highlight "assigned"	Building
27–36	Even when the side was assigned, readers still tended to judge the writers as believing what they wrote.	Reader icon with a thought bubble over the essay	Highlight "still tended to judge"	Reveal
36–45	We tend to read people's actions as personality and underweight the situation behind them.	Spotlight on the person, situation in shadow	Highlight "the situation"	Explaining
45–54	The effect seems stronger in some cultures than others, but it shows up widely. Next time, ask what the situation was.	Globe icon, then a situation checklist	Highlight "ask what the situation was"	Practical
54–60 CTA	Who did you misjudge before you knew their whole situation?	Figure with context panel revealed	Hold question 1.5 s	Warm

VERIFY WITH	Jones & Harris (1967) · Ross (1977) · APA Dictionary of Psychology: "fundamental attribution error"
EVIDENCE	**Well supported.** A textbook finding repeated many times; the voiceover notes its strength varies by culture.
MYTH CHECK	No common myth.

Make it yours

3 swaps so it's your video

1. Open on a traffic-jam drawing behind a running-late figure.
2. Add your own story of misjudging a coworker or classmate.
3. Swap the CTA: ask viewers about a time they were misjudged.

Your Most Vivid Memories May Be Less Accurate

BEAT TIMELINE (SECONDS) · TOPIC: FLASHBULB MEMORIES

0 3 10 18 27 36 45 54 60

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	Your most vivid memories? Maybe not so accurate.	Camera-flash graphic over a blank screen	▸ Big card: VIVID BUT WRONG?	Intriguing
3–10	A flashbulb memory is a sharp, detailed memory of where you were when you heard shocking news.	Photo-frame graphic with a blurred scene	‖ Pause after “shocking news”	Explaining
10–18	They feel like photographs. So psychologists tested them by asking people right after big news, then again months or years later.	Two notepads: day one and years later	▸ New card: “like photographs”	Building
18–27	In a 1992 study, students wrote down how they heard about a space shuttle disaster the day after it happened.	Generic rocket icon, notepad with handwriting	Highlight “the day after”	Storyteller
27–36	About two and a half years later, many of their new accounts differed sharply from what they had written.	Two notes side by side, differences highlighted	Highlight “differed sharply”	Reveal
36–45	Yet many felt very confident, and some insisted their new version was right even when shown their own handwriting.	Confidence meter at full, note with a cross	Highlight “own handwriting”	Reveal
45–54	A 2003 study found the same pattern: vivid memories faded like ordinary ones, but confidence stayed high.	Two lines: accuracy falling, confidence flat	Highlight “confidence stayed high”	Confident
54–60 CTA	What news moment do you remember vividly? Write it down today.	Pen and notebook, comment bubble	Hold question 1.5 s	Warm

VERIFY WITH	Neisser & Harsch (1992) · Talarico & Rubin (2003) · APA Dictionary of Psychology: “flashbulb memory”
EVIDENCE	**Well supported.** Repeated in several studies; the voiceover says “many” rather than giving exact figures.
MYTH CHECK	**Popular version:** Flashbulb memories are exact snapshots that don't change. **Documented:** Studies show they change over time like ordinary memories, while people's confidence in them stays high.

Make it yours

3 swaps so it’s your video

1. Open on a camera-flash graphic over a blank news screen.
2. Show your own diary entry from a memorable day, if you kept one.
3. Swap the CTA: ask viewers to date a memory note and recheck later.

The Sound That Changes When You Watch the Lips

BEAT TIMELINE (SECONDS) · TOPIC: MCGURK EFFECT

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	Listen with your eyes closed. Now open them.	Animated mouth drawing, eyes-closed icon	▸ Big card: EYES CLOSED	Playful
3–10	In a 1976 study, people watched a video of a face saying one sound while the audio played another.	Animated mouth shaping a sound, audio wave below	‖ Pause after “played another”	Storyteller
10–18	The audio said 'ba.' The lips formed 'ga.' Many people reported hearing a third sound: 'da.'	Three cards: BA, GA, DA	▸ New card per sound	Reveal
18–27	Close your eyes and the sound goes back to 'ba.' Open them, and for many people it changes again.	Eye icon closing and opening	‖ Pause 1 s with eyes closed	Playful
27–36	This is the McGurk effect. It shows your brain blends what you see and hear into one experience.	Eye and ear icons merging into one bubble	▸ New card: “McGurk effect”	Explaining
36–45	Knowing the trick doesn't switch it off for many people. The illusion keeps working on repeat viewings.	Repeat loop icon over the mouth drawing	Highlight “doesn’t switch it off”	Intrigued
45–54	Not everyone experiences it, and strength varies by person and language. But it's a famous sign that hearing isn't just ears.	Bar chart: effect strength varies by person	Highlight “varies”	Fair
54–60 CTA	What did you hear: ba, ga or da?	Three answer buttons: BA, GA, DA	Hold question 1.5 s	Playful

VERIFY WITH	McGurk & MacDonald (1976) · APA Dictionary of Psychology: “McGurk effect”
EVIDENCE	**Well supported.** A robust, often repeated illusion; the voiceover notes that not everyone experiences it.
MYTH CHECK	No common myth.

Make it yours

3 swaps so it’s your video

1. Use a simple animated mouth you draw, synced to the sound.
2. Add a second pair: lips saying “fa” over a “ba” sound.
3. Swap the CTA: ask viewers to test it with sound off and on.

PIN What did you hear? Ba, ga or da?

The Stanford Prison Experiment: Why It's Disputed

BEAT TIMELINE (SECONDS) · TOPIC: STANFORD PRISON EXPERIMENT

0 3 10 18 27 36 45 54 60

TIME (S)	VOICEOVER	VISUAL	CAPTION / PAUSE	TONE
0–3 HOOK	The famous prison study? Its lesson is now disputed.	Simple drawn icons: keys, bars, a question mark	▸ Big card: DISPUTED	Serious
3–10	In 1971, students were randomly assigned to be guards or prisoners in a mock prison in a university basement.	Basement floor-plan drawing with two role badges	‖ Pause after “basement”	Storyteller
10–18	Planned for two weeks, it was stopped after six days, as some guards treated prisoners harshly and prisoners grew distressed.	Calendar: 14 days planned, stop sign at day 6	Highlight “after six days”	Neutral
18–27	The popular takeaway: give ordinary people a role and power, and they'll turn cruel on their own.	Text card with the popular takeaway	▸ New card: “popular takeaway”	Skeptical
27–36	But it was one small study with no comparison group, and no close repeat has confirmed its conclusions.	Diagram: one study, no comparison group	Highlight “no comparison group”	Fair
36–45	Later reviews of recordings and archives suggest guards were encouraged to act tough, so the behavior wasn't purely spontaneous.	Archive box and tape icons, magnifier	Highlight “encouraged to act tough”	Reveal
45–54	A later prison study filmed for TV found guards didn't simply turn harsh. Many psychologists now treat the original as a cautionary tale.	TV icon, scale tipping toward “disputed”	▸ New card: “cautionary tale”	Careful
54–60 CTA	What do you think: does power change people, or do roles?	Two icons: crown and name badge, comment bubble	Hold question 1.5 s	Warm

VERIFY WITH	Haney, Banks & Zimbardo (1973) · Reicher & Haslam (2006) · APA Dictionary of Psychology: “Stanford prison experiment”
EVIDENCE	**Mixed.** The voiceover presents the popular lesson as disputed and gives the main criticisms.
MYTH CHECK	**Popular version:** Ordinary people given power over others turn cruel on their own. **Documented:** It was one small study without a comparison group; records suggest guards were encouraged, and a later study found different results.

Make it yours

3 swaps so it's your video

1. Use simple drawn icons of keys and bars, never film footage.
2. Add your own question about a time a role changed how you acted.
3. Swap the CTA: ask whether viewers think the study should still be taught.

Ready to post

TITLE The Stanford Prison Experiment: Why It's Disputed

DESCRIPTION Why the famous prison study's conclusions are now disputed.

HASHTAGS #psychology #stanfordprisonexperiment #socialpsychology

COVER TEXT Famous study, disputed lesson

PIN Should this study still be taught? Why or why not?

Turn a script into a video in 6 steps

A generic workflow for any stock library, any text-to-speech tool or your own voice, any editor with captions and any simple graphics app.

1. **Personalize and check**
   Apply at least one “Make it yours” swap, look up the core claim in the “Verify with” reference, and keep your wording as careful as the Evidence tag. Read the script aloud once with a timer.

2. **Record the voiceover**
   Paste the Voiceover column into any text-to-speech tool, or record yourself at about 150 words per minute. Leave the pauses from the Caption / pause column.

3. **Make or gather visuals you have rights to**
   On-screen tests and text cards, simple diagrams and charts, illusion graphics and animated icons from any simple graphics app, plus licensed stock clips. No TV or film clips.

4. **Cut beat by beat**
   Use the Time (s) column as your edit list: one cut or overlay change at each beat boundary. The beat timeline on each page shows where they fall.

5. **Add captions**
   Big captions, 1–3 words per card, made in any editor with captions. Highlight the words named in the Caption / pause column and hold the final question on screen for about 1.5 s.

6. **Post and pin**
   Use the “Ready to post” box: title, description, hashtags and cover text. Turn on any disclosure the platform requires, and pin the suggested comment.

Batch tip: the CSV edit list

Open `script_beats.csv` in Google Sheets or Excel and filter by `script_id`. Each row is one beat with start and end seconds, voiceover, visual, caption and tone: an edit list to keep open next to your editor.

Make a series

Pair a script with a hook of the same theme for a follow-up video, or use a “Didn’t replicate” hook to open a series on famous findings and what happened next.

FAQ

Which themes are covered?

8 themes: Cognitive biases; Memory & learning; Perception & illusions; Classic experiments & social behaviour; Decisions & choices; Emotions & everyday mind; Sleep & dreams; Pop-psych myths & failed replications. Each has at least 7 scripts.

How many hooks are there?

150 hooks: 10 hook types × 15 hooks each (H001–H150). 8 of the 10 types are psychology-only structures (Your brain is lying to There's a word for that); Myth busted and Would you? complete the set.

What does the Evidence tag mean?

Well supported = repeatedly replicated or textbook consensus. Mixed = a real effect, but smaller, debated or limited to some conditions. Did not replicate = a famous claim that large replication attempts did not confirm. The voiceover wording matches the tag.

What is NOT covered?

- Diagnosis or "signs you have [condition]" content
- Therapy, medication or mental-health treatment advice
- Suicide, self-harm or eating-disorder topics
- "Dark psychology" manipulation or seduction tactics
- Lie detection or "read anyone" body-language claims presented as reliable
- Personality-type tests (MBTI) as science
- Analysis of real living people or celebrities
- Non-English text

Can I add my own hooks?

Yes. hooks.csv is a plain spreadsheet you can extend with your own rows. There is no generator.

Does it batch-generate a week of scripts?

No. It is a library of 60 finished scripts, not a generator or an app. 60 scripts = 2 months at 1 per day, or 3 weeks at 3 per day.

Does the same story come in 30, 45 and 60 s versions?

No. Each story is written at one length only: 20 at 30 s, 20 at 45 s and 20 at 60 s. The longest script is 60 s.

Are the claims guaranteed?

No. We are not psychologists and no outside expert reviewed the scripts. Check each claim against the named "Verify with" reference before posting. Not mental-health advice.

License

Simple version: use the scripts in your own content as much as you like; don't resell or share the pack.

You can

- Use any hook or script, as written or edited, in your own videos, Shorts, Reels, posts and captions.
- Use them for personal or commercial purposes, including your own monetized channels, on any number of your own channels.
- Edit, shorten, extend, translate or combine them, and read them with your own voice or any text-to-speech voice.
- Import the CSV files into your own tools, sheets and editing workflows, and add your own rows.

You can't

- Resell, share, give away or upload this pack, the PDFs or the CSV files, in whole or in part.
- Publish the scripts or hooks as a script product: a script pack, template, prompt pack, course, e-book or any other text product.

Good to know

- One purchase covers one creator, or one channel team working on the same channels.
- Check each claim against the named reference before posting; you are responsible for what you publish. Nothing here is mental-health advice.
- Faceless Creator Kit is an independent shop and is not affiliated with any video platform, publisher, university or researcher named in this book.

Thank you for buying from Faceless Creator Kit.
